REACT PROPS

PROPS VS STATE

- Think of Props as components attributes, or "configuration". They are received from parent components.
- A component manages its own state internally. State usually starts with a default value defined in the component's constructor and then suffers from mutations in time (in. eg. generated from user events).

AGENDA

- Props and Component Composition
- Default Props
- Children prop
- React.Children API

PROPS AND COMPONENT COMPOSITION

PROPS & COMPONENT COMPOSITION

- Composing component is an essential pattern in React for building complex UIs and applications.
- Props are of key importance in component composition.
 They are the mechanism used in React for passing data from parent to child components.
- Props are Read-Only: They can't be changed from inside.
 they are passed and "owned" by the parent component.

PROPS & COMPONENT COMPOSITION

```
function TodoApp() {
 return (
   <div>
     <div className="todo-item"><input type="checkbox" checked={true}/>
       Buy Milk
     </div>
     <div className="todo-item"><input type="checkbox" checked={false}/>
       Buy Cookies
     </div>
     <div className="todo-item"><input type="checkbox" checked={false}/>
       Learn React
     </div>
   </div>
```

PROPS & COMPONENT COMPOSITION

```
function TodoItem({checked, children}) {
  return <div className="todo-item">
          <input type="checkbox" checked={checked}/>{children}</div>;
function TodoApp() {
  return (
    <div>
     <TodoItem checked={true} children="Buy Milk" />
     <TodoItem checked={false} children="Buy Cookies" />
     <TodoItem checked={false} children="Learn React" />
    </div>
```

You can define default values for your props by assigning to the special defaultProps property:

 Used to ensure that a given prop will have a value if it was not specified by the parent component.

```
function TodoItem({checked, children}) {
  return <div className="todo-item">
          <input type="checkbox" checked={checked}/>{children}</div>;
function TodoApp() {
  return (
    <div>
      <TodoItem checked={true} children="Buy Milk" />
      <TodoItem checked={false} children="Buy Cookies" />
      <TodoItem checked={false} children="Learn React" />
    </div>
```

```
function TodoItem({checked, children}) {
  return <div className="todo-item">
          <input type="checkbox" checked={checked}/>{children}</div>;
TodoItem.defaultProps = {
  checked: false
};
function TodoApp() {
  return (
    <div>
      <TodoItem checked={true} children="Buy Milk" />
      <TodoItem checked={false} children="Buy Cookies" />
      <TodoItem checked={false} children="Learn React" />
    </div>
```

11

```
function TodoItem({checked, children}) {
  return <div className="todo-item">
          <input type="checkbox" checked={checked}/>{children}</div>;
TodoItem.defaultProps = {
  checked: false
};
function TodoApp() {
  return (
    <div>
      <TodoItem checked={true} children="Buy Milk" />
      <TodoItem children="Buy Cookies" />
      <TodoItem children="Learn React" />
    </div>
```

CHILDREN PROP

- props.children is a special property:
 - Automatically assigned to the content between the opening and closing tags

```
function TodoItem({checked, children}) {
  return <div className="todo-item">
          <input type="checkbox" checked={checked}/>{children}</div>;
TodoItem.defaultProps = {
  checked: false
};
function TodoApp() {
  return (
    <div>
      <TodoItem checked={true} children="Buy Milk" />
      <TodoItem children="Buy Cookies" />
      <TodoItem children="Learn React" />
    </div>
```

```
function TodoItem({checked, children}) {
  return <div className="todo-item">
          <input type="checkbox" checked={checked}/>{children}</div>;
TodoItem.defaultProps = {
  checked: false
};
function TodoApp() {
  return (
    <div>
      <TodoItem checked={true}>Buy Milk</TodoItem>
      <TodoItem>Buy Cookies</TodoItem>
      <TodoItem>Learn React</TodoItem>
    </div>
```

props.children is a special property:

- Automatically assigned to the content between the opening and closing tags
- Usually used with components that don't know what JSX they will render ahead of time. (especially common for components like Sidebar or Dialog that represent generic "boxes")
- Can have one element, multiple elements, or none at all

```
function FancyBorder(props) {
  return (
    <div className={'FancyBorder FancyBorder-' + props.color}>
      {props.children}
    </div>
function WelcomeDialog() {
  return (
    <FancyBorder color="blue">
      <h1>Welcome</h1>
      >
        Thank you for visiting our spacecraft!
      </FancyBorder>
```

REACT.CHILDREN

- Top-Level React API
- Provides utilities for dealing with the props.children
 - map, count etc...
